## Alzheimer's Disease Burden

- 5.5 million with Alzheimer's in the US (projected to be over 14 million by 2030)
- \$259 billion costs in 2017
- Dementia most expensive disease in America
- 5th leading cause of death among Americans aged 65 and older

## DRUG TRIALS OF AD

### Drug trials to combat dementia Have Failed

- Between 2002 and 2012, 413 clinical trials tested 244 compounds.
- Only one was approved
- Highest failures rates of any disease
- 99.6%, compared with 81% for cancer.

### Leisure-time physical activity at midlife and the risk of dementia and Alzheimer's disease

Savi Roviö, Ingemar Kåreholt, Eva-Liisa Heikkinen, Matti Vilitanen, Bengt Winblad, Jaska Tuomilehto, Hilkka Soininen, Aulikki Nissinen, Mia Kivipelto  Lancet Neurology, 2005

- 1449 / 2000 participants from previous cardiovascular risk studies.
- Average age 50.1 initially and 71.6 when re-examined
- Asked about activity lasting at least 20-30 min and causing breathlessness and sweating

Odds ratio (or risk) for dementia in active vs. sedentary

Dementia	Alzheimer's disease
0.48	0.38

Roviö et al., Lancet Neurol, 2005

## Social & Leisure activity effects

### Asked about activities and frequency

- Mental activity:** reading, writing, studying, crossword puzzles, painting or drawing
- Physical activity:** swimming, walking, or gymnastics
- Social activity:** theater, concerts, art exhibitions, traveling, cards/games, or social groups
- Productive activity:** gardening, housekeeping, cooking, working for pay after retirement, volunteer work, sewing, knitting, crocheting, or weaving.
- Recreational activity:** watching TV or listening to the radio

	No. of dementia cases	RR†	95% CI‡
<b>Mental activity</b>			
No	34	1	
Less than daily	60	0.81	0.52, 1.26
Daily	49	0.54	0.34, 0.87
<b>Physical activity</b>			
No	114	1	
Less than daily	6	0.97	0.42, 2.22

<b>Productive activity</b>			
No	94	1	
Less than weekly	3	0.95	0.30, 3.00
Daily-weekly	26	0.58	0.38, 0.91
<b>Recreational activity</b>			
No	102	1	
Less than daily	6	1.08	0.46, 2.45
Daily	15	0.35	0.22, 1.03

- 1,375 subjects (mean age: 81.1)
- Follow-up after approx. 7 years.
- Activities assessed by personal interview at recruitment

Wang et al., Am J Epidemiology, 2002

## Limitations in past dementia prevention studies

- Lack of Randomized Control Trials
- Single interventions
- Reverse causality – Does the factor cause/cure the disease or vice versa
  - Does exercise prevent dementia or do non-demented people exercise more?
- Communality – common underlying factors
  - Perhaps people who exercise more also have a better diet or are more active
- Correlation vs. causation

Alzheimer's & Dementia 9 (2013) 675-683

### FINGER study

(Finnish Geriatric Intervention Study to Prevent Cognitive Impairment and Disability)

- Randomized control trial of 1260 adults aged 60-77.
- Cognition at or slightly below expected mean for age (but no dementia)
- Multidimensional intervention vs. general health advice x 2 years.
  - Diet high in fruits, vegetables, whole grains, low-fat mild and meat, fish 2x/week, sucrose < 50g/day
  - Exercise (aerobic, strength, balance) 5x / week
  - Cognitive training: web based 3x / week for 10-15 min and 10 sessions led by a facilitator (educational+status)
  - Social: numerous group meetings
  - Management of metabolic and vascular risk factors.

Lancet 2015; 385: 2255-63

#### A 2 year multidomain intervention of diet, exercise, cognitive training, and vascular risk monitoring versus control to prevent cognitive decline in at-risk elderly people (FINGER): a randomised controlled trial

First authors: Jeroen Lefkowitz, Albert Solomon, Erika Lehtinen, Sanna Alhainen, Ritva Anttilainen, Lari Blomman, Tuomo Hänninen, Antti Jula, Pekka Korhonen, Jarmo Lindholm, Fransiska Moringaaho, Tommy Paavonen, Satu Pajala, Markku Paikkinen, Riitta Raasänen, Anne Salonen, Timo Strandberg, Jaakko Tuomilehto, Heikki Vasanen, Mikko Veitola

**FINGER**

N = 1260  
Age: 60-77 years

→

**MULTIDOMAIN INTERVENTION**

- Nutrition
- Exercise
- Cognitive training
- Vascular risk monitoring

→

**REGULAR HEALTH ADVICE**

→

**2 years**

24 months

p=0.01

**Subsequent Findings**

Intervention vs. Comparison	OR	95% CI
1. 10 years of disease	0.6	0.4-0.8
2. 15 years of disease	0.5	0.3-0.8
3. 20 years of disease	0.4	0.2-0.8

60% lower risk

30% lower risk of ADL decline

Interpretation Findings from this large, long-term, randomised controlled trial suggest that a multidomain intervention could improve or maintain cognitive functioning in at-risk elderly people from the general population.

Extended 5- & 7-year follow-up ongoing...

**U.S. Study to PrOTect brain health through lifestyle INTERvention to Reduce risk (U.S. POINTER)**  
 — sponsored by the Alzheimer Association

- Two-year clinical trial of 2,000 healthy older adults at risk for cognitive decline
- Tests whether lifestyle intervention can protect cognitive function
- Modeled after the FINGER study
- First study to examine this combined intervention in a large-scale U.S.-based population.

**Intervention Methods will Include:**

  
 Physical Exercise

  
 Nutritional Counseling & Modification (MIND)

  
 Cognitive & Social Stimulation

  
 Improved Self-Management of Health Status

Screening 1: Research clinic initiates electronic medical record search to identify candidates.  
Screening 2: Eligible candidates receive letter assessing interest & questionnaires to identify those who are sedentary, consume a poor diet, and have a 1st degree family history of memory impairment.  
Screening 3: Eligible candidates complete telephone cognitive assessment to exclude prevalent cognitive impairment.

**Recruitment (N=400 per site)**  
**4 Sites identified**  
**1 sites TBA**

### NIA-Commissioned Report by Agency for Healthcare Research & Quality (AHRQ):

#### Prevention Recommendations

**Evidence insufficient – largely because only a few studies have examined interventions with multimodal lifestyle components**

Intervention	Key Message
Multimodal Lifestyle Interventions	<ul style="list-style-type: none"> <li>Evidence is insufficient to conclude whether multimodal interventions offer benefits for cognitive performance or incidence of MCI or CATD, largely because few studies have examined interventions with similar components.</li> <li>Low-strength evidence shows that a multimodal intervention composed of diet, physical activity, and cognitive training provides benefits in executive function, attention/processing speed.</li> <li>Low-strength evidence shows that a multimodal intervention composed of lifestyle advice and drug treatment is not effective in reducing incidence of CATD or benefiting brief cognitive test performance or memory.</li> </ul>

**Low-strength evidence that multimodal intervention provides benefits in executive function, attention, and processing speed**

---

---

---

---

---

---

---

---

**Cohort:**

2000 cognitively normal older adults (60-79 years) at increased risk for cognitive decline due to sedentary lifestyle, poor diet, suboptimum cardiovascular health status, and 1<sup>st</sup> degree family history of significant memory impairment.

**Primary Aim:**

Assess effects of random assignment to a Self-Guided vs. Structured Lifestyle Intervention focused on increasing aerobic exercise, adherence to the MIND diet, cognitive and social stimulation, and guideline-based health coaching to manage cardiometabolic risk factors on 2-year cognitive trajectory (based on a global cognitive composite outcome).

---

---

---

---

---

---

---

---

**What is the Point of POINTER ?**

- To test whether FINGER findings can be replicated in a heterogeneous cohort of older Americans who are at risk for cognitive decline and AD, using a more pragmatic trial approach
- To adapt FINGER lifestyle interventions to fit into American culture
- To identify and develop a community-based infrastructure that could support a sustainable brain health lifestyle program if the trial results are positive

---

---

---

---

---

---

---

---

**Interventions**

Self-Guided Lifestyle Intervention

Structured Lifestyle Intervention

Differ in format, expectations, and accountability

---

---

---

---

---

---

---

---

**U.S. POINTER**  
alzheimer's association

## Interventions

### Self-Guided Lifestyle Intervention

- Education & Support:** Group meetings 2-3 times per year to provide tangible resources & encouragement to support self-selected plans
- Guideline-Based Health Monitoring:** Annual physical exam & blood tests

### Structured Lifestyle Intervention

- Exercise** (mostly aerobic): 4x per week primarily at a YMCA
- Nutrition:** MIND diet (modified Mediterranean)
- Cognitive Stimulation:** Computer cognitive training (BrainHQ), regular group meetings to encourage social/intellectual challenge
- Guideline-Based Health Coaching:** Frequent exams, blood tests & goal-setting

---

---

---

---

---

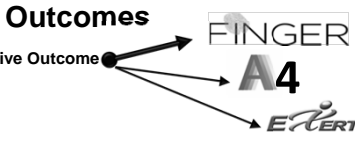

---

---

---

**U.S. POINTER**  
alzheimer's association

## Outcomes

- POINTER Primary Cognitive Outcome
- APOE
- Banked DNA and plasma
- Extensive health phenotyping (cardiovascular, metabolic)
- Self-report: subjective concerns, mood, sleep, QOL, health care utilization
- Ancillary studies (contact Rema Raman: [remar@usc.edu](mailto:remar@usc.edu))  
*Imaging (PET/MRI/fMRI) NIA funded; U19 microbiota NIA pending; actigraphy study (sleep, total activity)*
- Data sharing and harmonization with other trials, including WW-FINGERS

---

---

---

---

---

---

---

---

**U.S. POINTER**  
alzheimer's association

## Cognitive Outcomes

Outcomes	Cognitive Domain	Tests
Primary Composite	Memory	Free and Cued Selective Reminding Test
		Story Recall (SR)
		Visual Paired Associates
	Executive Function & Processing Speed	Number Span & Sequencing
		Word Fluency
		Digit Symbol Substitution
		Trails A & B
Secondary / Experimental	Global	Mini-Mental Status Exam
	Memory	Cogstate One-Card Learning, Face Name Memory Exam, Behavioral Pattern Separation of Objects
		Cogstate One Back
	Executive Function & Processing Speed	Digital Cognition Technologies Clock Drawing
